

Raccolta informazioni su macchina Metasploitable 192.168.50.100

OS fingerprinting

Scansione delle porte principali, dei servizi attivi su ciascuna porta e analisi del sistema operativo della macchina target.

Syn Scan

Esegue una scansione SYN, che significa che NON conclude il three-way-handshake, e scansiona tutte le porte well-known.

TCP Scan

Scan invasivo. Completa il 3-way-handshake, creando così un canale di comunicazione. Recupera informazioni sullo stato della porta, ma crea più «rumore a livello network» ed è dunque una tecnica di scanning più identificabile e che su grosse reti potrebbe creare congestioni di rete.

I risultati della scansione SYN e TCP non hanno differenze, quello che cambia è la metodologia utilizzata:

SYN scan (nmap -sS): non completa il three-way-handshake, è meno invasiva, solitamente più rapida ma meno affidabile

TCP scan (nmap -sT): completa il three-way-handshake, è più invasiva e solitamente più lenta (quindi ha maggiori probabilità di essere rilevata). Crea una connessione alle porte e pertanto è più affidabile.

Version detection (banner grabbing)

Scansione delle porte principali e della versione dei servizi attivi su ciascuna porta, analisi del sistema operativo della macchina target.

Report

Lo scan nmap -sV restituisce informazioni su:

- IP
- Sistema Operativo
- Porte Aperte
- Servizi in ascolto con versione
- Descrizione del servizio

Lo switch -oN permette di salvare il risultato della scansione in un file.
